DETAILED ACTION

1. This communication is responsive to Amendment filed 04/22/05.

2. Claims 1-21 are pending in this application. Claims 1, 7, 10-11, 14, and 17-21 are independent claims. This Office Action is made final.

Drawings

3. The drawings are objected to because Figures 8-9 dated 03/12/2002 are not quite clear to view in detail. No replacement drawing sheet is received in 04/22/05 as mentioned in the remark. Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will

be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 5. Claims 1-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Pasko et al. ("Optimization Method for Broadband Modern FIR Filter Design using Common Sub-expression Elimination").

Re claim 1, Pasko et al. disclose 2-3 a filter coefficient design method (abstract) in a digital filter (FIR filter in abstract lines 1-5 page 100) having a plurality of filter coefficients that are expressed with CSD code words of n bits (n: natural number more than 2) (e.g. page 100 right column lines 9-16), comprising the step of: making code word sub-expression for random filter coefficients out of the filter coefficients as a virtual common sub-expression that is relevant to a predetermined common sub-expression so that adders are shared with the common sub-expression in tap Lines of the random filter coefficients (e.g. Figure 2 and left column page 101 under method overview section).

Re claim 2, Pasko et al. further disclose 2-3 the virtual common sub-expression becomes identical to the common sub-expression through bit-shift (e.g. double arrow in Figure 3c).

Re claim 3, Pasko et al. further disclose 2-3 the virtual common sub-expression becomes identical to the common sub-expression through bit-add (e.g. addition box in Figure 3c).

Re claim 4, Pasko et al. further disclose 2-3 the virtual common sub-expression becomes identical to the common sub-expression through bit- inversion (e.g. minus sign in the last box of addition in Figure 3c).

Re claim 5, Pasko et al. further disclose 2-3 the virtual common sub-expression becomes identical to the common sub-expression through at least two more processes out of bit-shift, bit-add and bit-inversion (e.g. Figure 3 contains all the shift, add, subtract/inversion).

Re claim 6, Pasko et al. further disclose 2-3 the digital filter is a linear phase FIR filter (e.g. Figure 3a).

Re claim 7, Pasko et al. disclose in Figures 2-3 a method for receiving and filtering input signals of digital samples of k bits (k: natural numbers more than 4) in a digital filter having filter characteristics that are created by filter coefficients being expressed as CSD code words of n bits (n: natural numbers more than 2), comprising the steps: creating as a virtual common sub-expression (e.g. CSD coefficients set-optimized in Figure 2) common sub-expressions created by bit-shift, bit-add, or bit-inversion (e.g. these operations are seen in Figure 3c) of random coefficient sub-expressions (e.g. Figure 3a wherein h0-h2 are coefficients of the FIR filter) out of the digital filter coefficients, thereafter shifting the digital samples by the number of bits corresponding to the common sub-expression and the virtual common sub-expression, adding (e.g. all the addition

boxes in Figure 3c) up all the digital samples shifted by the number of bits corresponding to the common sub-expressions to obtain a composite output value of a common coefficient tap line; obtaining composite output values of random coefficient tap lines by adding up (e.g. y0-y2) the digital samples shifted by the number of bits corresponding to the virtual common sub-expression and the composite output value of the common coefficient tap line being used as a common input; and performing in order delaying (e.g. Figure 3a wherein z⁻¹ is the delay for proper FIR fitler) and adding to create filter output values by subsequent compositions of the composite output values of the common coefficient tap Lines and the composite output values of the random coefficient tap lines.

Re claim 8, Pasko et al. further disclose in Figures 2-3 the number of the tap Lines is set as 73 in case where the digital filter is used in a middle frequency terminal of a mobile radio communication system (e.g. page 101 last line of left column and first line of the right column).

Re claim 9, Pasko et al. further disclose in Figures 2-3 the number of bits of the CDS code word is 24 bits (e.g. page 101 last line of left column and first line of the right column).

Re claim 10, Pasko et al. disclose in Figures 2-a digital filter, comprising: a shift register group (e.g. >>3 and >>2 in Figure 3c) including first shift register members each receiving digital samples of k bits as input signals and shifting the received digital samples by bit shift values of filter coefficients that are defined as common sub-expressions out of filter coefficients that are expressed as code words of n bits within CSD code, and second shift register members shifting code words of the other filter

coefficients that are not defined as the common sub-expressions by using the code words of the common sub-expressions, a adder group (e.g. all addition boxes in Figure 3c) including first composite members adding up the shifted digital samples that are output from the first shift register members to provide them to common tap Lines, and second composite members for adding the shifted digital samples that are output from the second shift register members to the composite outputs of the common tap Lines to provide the results to each of corresponding tap Lines; a delay group (e.g. all z⁻¹ in Figure 3a) including a plurality of delayers connected to the tap Lines and being connected in series from one another to provide delay to the composite outputs; and an output adder (e.g. last adder in Figure 3a) group including a plurality of adders for adding up the outputs of the delayers and the composite outputs of the tap Lines to create digital output signals of k bit(s).

Re claim 11, it has same limitations cited in claim 10. Thus, claim 11 is also rejected under the same rationale as cited in the rejection of rejected claim 10.

Re claim 12, Pasko et al. further disclose in Figures 2-3 the common tap Line is a tap Line of filter coefficients having the greatest number of common coefficient sub-expressions out of the filter coefficients (e.g. page 102 right column lines 1-10).

Re claim 13, Pasko et al. further disclose in Figures 2-3 the digital filter is designed with software by a digital signal processor performing shifting, adding, and delaying (e.g. page 100 left column first paragraph under the introduction section and all the section under page 102 right column including pattern identification, pattern selection, and searching algorithm).

Re claim 14, it is a method claim of claim 1. Thus, claim 14 is also rejected under the same rationale as cited in the rejection of rejected claim 1.

Re claim 15, Pasko et al. further disclose in Figures 2-3 at least the second sub-expression is formed from the virtual common sub-expression through at least one of a bit-shift, a bit-add and a bit-inversion (e.g. Figure 3b).

Re claim 16, it is a method claim of claim 5. Thus, claim 16 is also rejected under the same rationale as cited in the rejection of rejected claim 5.

Re claim 17, it is a program storage device claim of claim 1. Thus, claim 17 is also rejected under the same rationale as cited in the rejection of rejected claim 1.

Re claim 18, it is a system claim of claim 1. Thus, claim 18 is also rejected under the same rationale as cited in the rejection of rejected claim 1.

Re claim 19, Pasko et al. disclose in Figures 2-3 at least one shift register (e.g. >>3 and >>2 in Figure 3c) for receiving digital samples of input signals and shifting the received digital samples by bit-shift values of filter coefficients that are defined relative to a virtual common sub-expression; a first adder (e.g. first adder that add x and -x>>3 in Figure 3c) for adding shifted digital samples that are output from the at least one shift register to drive a common tap Line; a second adder (e.g. adder for yielding y1 in Figure 3c) for adding shifted digital samples that are output from the at Least one shift register to the output of the common tap line to drive a tap line corresponding to a filter coefficient; and at Least one delay unit (e.g. z⁻¹ in Figure 3a) connected to a tap Line for delaying an output signal component.

Re claim 20, it has same limitations cited claim 19. Thus, claim 20 is also rejected under the same rationale as cited in the rejection of rejected claim 19.

Re claim 21, it is a program storage device claim of claim 20. Thus, claim 21 is also rejected under the same rationale as cited in the rejection of rejected claim 20.

Response to Arguments

- 6. Applicant's arguments filed 04/22/2005 have been fully considered but they are not persuasive.
 - a. The applicant argues in page 13 first and second paragraphs for claims 1, 7, 14, and 17-21 that the cited reference by Pasko et al. does not disclose the limitations cited in claim 1 of the invention. In particular, Pasko et al. do not diclose a method of making a code word subexpression...as a virtual common subexpression that is relevant to a predetermined common subexpression.

The examiner respectfully submits that the rejections of claims 1, 7, 14, and 17-21 are clearly made with citations as seen above. In particularly, the cited reference by Pasko et al. does disclose the code word subexpression...as a virtual common subexpression that is relevant to a predetermined common subexpression in the Figure 3(c) in page 102 wherein the virtual common subexpressions are shared with others to yield final results.

b. The applicant argues in page 13 last paragraph for claims 10-11 that the cited reference by Pasko et al. fails to disclose or address "shifting code words of the other

filter coefficients that are not defined as the common subexpressions by using the code words of the common subexpressions" and "adding the shifted digital samples that are output form the second shift register members".

The examiner respectfully submits that Figure 3(c) in page 102 of the cited reference by Pasko et al. clearly discloses or address the "shifting code words of the other filter coefficients that are not defined as the common subexpressions by using the code words of the common subexpressions" and "adding the shifted digital samples that are output form the second shift register members" wherein the shifting of uncommon subexpressions is done in second stage of shifting (e.g. >>1, >>6, >>3, and >>2) and the adding is done in the final stage to yield y0-y2.

Conclusion

7. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chat C. Do whose telephone number is (571) 272-3721. The examiner can normally be reached on M => F from 7:00 AM to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chaki Kakali can be reached on (571) 272-3719. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
